<div align="center">Project 12</div>

1. What is the name of your product, and why did you initially choose to use it? If you were using it prior to this course, report on what led you to begin using it.

I was using eclipse. I initially choose to use it because my friend told me it was easy to use and that he used it before.

2. How long and difficult was your learning curve on this product? Did it seem intuitive to use from the beginning, did it take you very long to begin using it with a comfortable level of fluency?

The learning curve for eclipse was very low. Once I got it set up to follow the coding standers that were required it was very straight forwards to use.

3. How well did the product work specifically for the initial writing of your code? Was it easy to configure your writing preferences, was it consistently easy to open the program and begin developing code?

For initial writing of the code it was very easy. Configuring my writing preferences was very easy to do. Opening eclipse, it always opened to the last project that was open.

4. How well did the product work specifically for debugging your code? Was it easy to set and use breakpoints, was it easy to trace through the code, into and out of methods, etc.? Comment on the benefits or issues you experienced while debugging.

It was very easy to debug my code.

5. Would you recommend the product you used to other students and/or programmers? What would you tell them about the product if they had not used it previously? What would you warn them about and/or what would you tell them that they will appreciate.

I would recommend this product to other students because it was easy to use and to format the way I wanted it to look like. There is a little bug with java docs that is there is no blank line between the end of one method and the start of a java doc.
